Abstract: Computer users who still primarily work in networks require that the access to their data and resources in general is granted only to those that they allow to – just as in the case of physical property, the users of computer systems want the socalled computer security. The Internet, as the best known computer network, connects millions of people around the world granting them access primarily to a large amount of information and its users need to have the necessary means in order to achieve a given level of security. Systems for detecting intrusion in a computer system (IDS-instrusion detection system), solve the problem of unwanted network access. There are open-source and closed-commercial code IDS and it is important to have an insight into their advantages and disadvantages.
Keywords: Intrusion detection system, Snort, Netwitness, Commview.
